

CLEARING

Pay creators for real views,
always at the true price.

Today, someone guesses

Right now, paying a creator means writing a reward table before a single post goes live: *10,000 views earns Rs. 500, 50,000 views earns Rs. 2,000*, and so on. Whoever writes that table is guessing how far the content will travel, and every guess is a gamble with your money. Guess low, and it's trivial to clear, so you overpay for reach that wasn't worth it. Guess high, and creators chase a number they'll never hit and give up. Either way, nobody can explain why the goal sits at 250,000 views instead of 200,000. The number was arbitrary from the start.

What we do instead

You give us two things: a budget, and a rough price per view you'd be happy with. That's the whole setup on your side: one form, one submission.

From that alone, three guarantees hold for the whole campaign:

- **You can never go over budget.** Spend is capped at exactly what you put in, as a mathematical property of the settlement, every single time.
- **You always pay the correct price for the reach you actually got.** A lot of creators showing up makes it cheaper; a thin campaign settles fair and **returns what wasn't earned.** Either way, the price is calculated from what happened, after the campaign runs.
- **The price comes from the market itself.** You, we, and the creator all let the numbers speak, which makes lowballing and haggling equally pointless.

Goals that can never be set wrong

Creators still climb a ladder of goals, exactly as before. What's new is that the placement of those goals can never cost you anything. However they're set (easy or hard, five of them or fifteen, one shared ladder or a different one for every creator), the price you pay is worked out separately, from the reach that actually showed up. A goal decides who gets a moment to celebrate, and when; the budget is settled on its own terms.

That turns goal design into a pure creative choice. Make it harder, easier, shorter, longer: it's a dial you can turn freely. Taken all the way, **every creator could run their own personal game**, their own pace, their own difficulty, and what you pay stays exactly as correct as it would be with one ladder for everyone.

The goals also look after themselves. When a whole group of creators is genuinely finding theirs harder than intended, the system senses it and eases them automatically. In our simulations, this self-healing step alone rescued **46 of 400 campaigns**, about one in nine, each one paying real creators who would otherwise have earned nothing.

The pool heals itself against bad actors

Because every creator is paid out of one shared pool rather than promised an individual rate, dealing with a suspicious or fake account is simple: we just take them out of the pool. Nothing else about the setup changes, no rule is rewritten for anyone else, and no one else's goals move. The market quietly re-prices itself around whoever is left, so the price you pay always reflects who's actually real.

Did it work? 400 simulated campaigns, paid both ways

We ran hundreds of simulated campaigns, spanning many budgets and crowd sizes across good markets and thin ones, through the old way and through Clearing, and compared what actually happened to the same money and the same reach.

	The old way	Clearing
Campaigns exceeding budget	54%	0%
Worst overspend recorded	55.8× budget	not possible, by design
Payout-odds gap, smallest vs. largest creators	34 percentage points	0.3 percentage points
Campaigns rescued by self-healing goals	not applicable	11.5%

Same reach, two different rulebooks. The only thing that changed was how the money moved.

What this means for you

- **No overbudgeting, ever.** It's a fact about how the money moves, built into the mechanism itself.
- **Rungs are now a UX decision.** Set them to your own taste, easy or hard, few or many; the price you pay is worked out separately and never moves because of it.
- **Always a fair, comparable price.** What you pay per view reflects what the reach actually cost, every time.
- **A tiny setup.** Just your budget, and the price per view you'd think is fair. That's the entire form.

What it actually feels like

You open a form with two boxes: a budget, and the price per view you'd be happy paying. You submit it and go back to your day. Two weeks later, a summary lands in your inbox: *"Your campaign reached 6.4 lakh real people. You paid the fair price for every one of them, and Rs. 38,000 that nobody earned has been returned to you."* That email is the entire administrative load the campaign asked of you.

Two numbers. Then the market.
